

Common Rules

The goal of setting up coding standards for this project is to ensure we are writing good code.

Here are 9 top coding standards we are focusing on (reference: [Perforce](#)):

1. Know why you're using it.
2. Choose the best coding standard for your industry.
3. Use coding rules and follow recommendations.
4. Describe the intent behind the rule.
5. Update coding standards with care.
6. Consider open vs. closed standards.
7. Prioritize coding rules.
8. Plan for rule deviations.
9. Educate programmers.

In practice, this is what we are going to do:

General

- Always try your best to keep the comments and documentations up-to-date.

Database

- All columns and tables should be named in lower case and under dash line. to distinguish between operation scripts and tables/columns.
For more detailed reason see : <https://www.sqlshack.com/learn-sql-naming-conventions/>
